**Fleet management without detours –**
easy overview & quick updates

LARDIS

# LARDIS:ONE Fleet Management

## Clearly organised, flexible, over-the-air

Whether it's changing the configuration, software updates or new maps.

With LARDIS:ONE Fleet Management, you have everything under control - from the comfort of your desk.

Your fleet is automatically updated via WiFi or 4G as soon as a vehicle is on the network.

### Everything at a glance

With LARDIS:ONE Fleet Manager, you have your entire fleet under control at all times:

- **Clear display of all vehicles**
  Current configuration and software versions, notes and history

- **Group management**
  Combine similar vehicles into groups. This allows you to update all vehicles at once with just a few clicks. Individual customisations are no problem at all and are retained when changes are made to the base configuration.

- **Security**
  You can use certificates to ensure that your devices can only be changed via fleet management. Tampering is impossible.

- **User management**
  If required, you can restrict access to functions and vehicle groups for individual users.
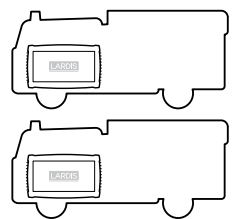

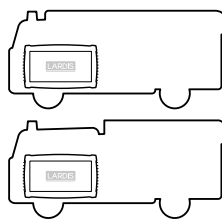

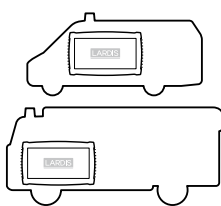

**Software**

**Maps**
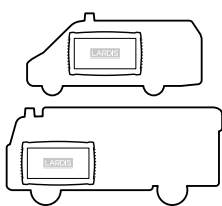

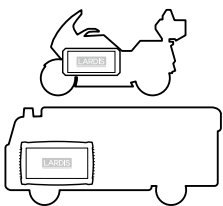

Base configuration

Custom configuration

**Fleet Server**
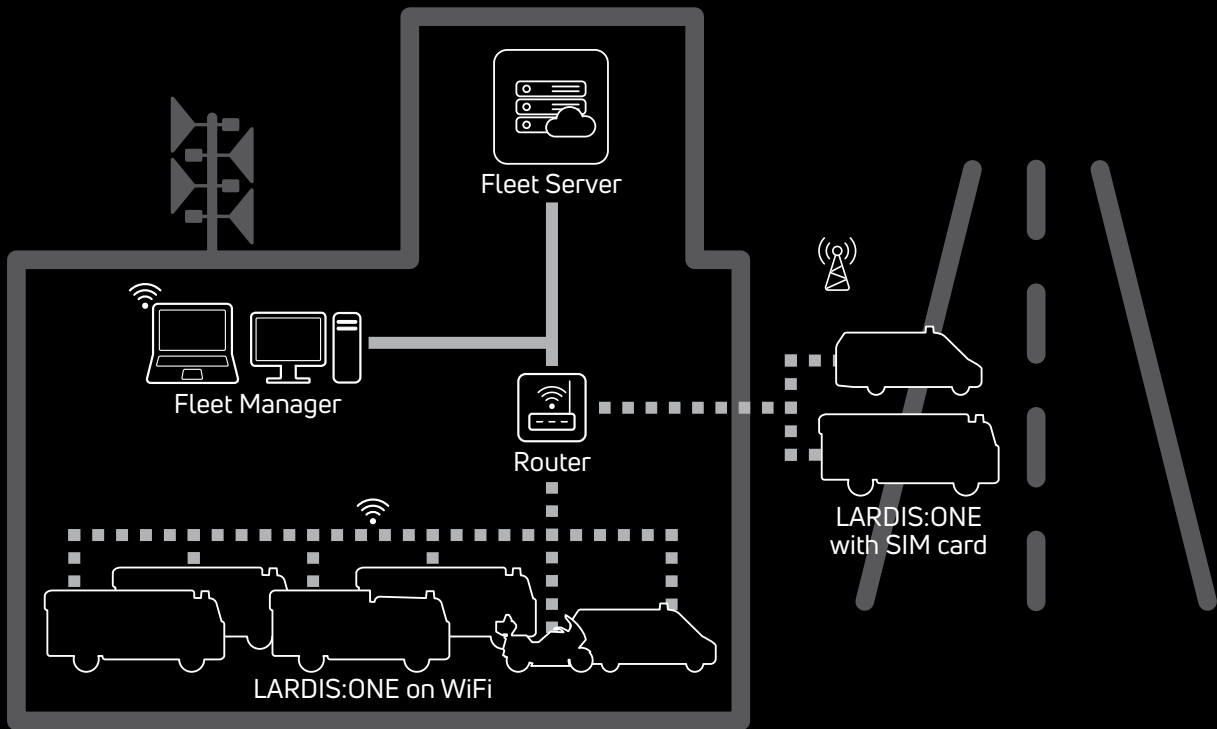

WiFi or 4G

## Completely wireless

Gone are the days of having to enter each vehicle to access the device.

The LARDIS:ONE Fleet Server detects when a vehicle enters WiFi range and then automatically installs any updates.

Vehicles stationed outside the server building can be connected via VPN.

If the vehicle leaves the WiFi range before updating is finished, the process will continue when it re-enters.

The device will not be updated until the download is complete. This can be initiated by the driver or the control center. Alternatively, an update via 4G is possible.
